If online privacy is a concern for you, there is a solution that will solve all your problems, and it's called VyprVPN, a personal Virtual Private Network solution from the same owners of Giganews.

What is VyprVPN?

VyprVPN is a software that provides a layer of security for your online communications.

How does it work?

VyprVPN creates a line of communication between your computer and VyprVPN servers. Then when you browse the internet, or check your email, your requests are passed through the VyprVPN servers instead of going directly to your target.

Then, the VyprVPN servers connects to the services you requested, retrieve the response and send it back to you.

What are the benefits?

- All your web browsing, email, IM, newsgroups reading are protected for your privacy. None of the servers will ever know your real IP address.
- You can choose between an IP address based on USA, Europe or Asia.
- It also helps for communications via wireless on public places.
- You still access all the applications you use today.

Where do I sign?
